EVIDENCE OF LIFE

MVP Document

August Fan Club · March 2026

> *Life deserves evidence, not just plans.*

Proof that you lived.

01 Core Flow: User → Action → Value

Who Is the User?

Students and young professionals who use Apple Calendar or Reminders. They plan their days, know plans change, take photos of moments that matter, and feel like weeks disappear without any clear record of what actually happened.

The Core Problem

Plans	Memories	Reality
Apple Calendar	Photos App	**Evidence of Life ✓**

The Flow

User	Action	Value
User arrives via waitlist / word of mouth	Connects Apple Calendar (and optionally Photos)	Sees a unified timeline: what was planned vs. what actually happened
Feels like time disappears without a record	Their past events auto-import as the Plan layer	Timeline updates daily — no new habits required
Wants proof of their days without journaling	Can log or confirm actual activity in seconds	Can scroll a week and instantly understand it

Core Value Proposition

> *For students and young professionals who feel like weeks disappear, Evidence of Life is the automatic private timeline that finally shows what actually happened — not just what was planned.*

02 Tech Stack

Overview

The app is built on Lovable — an AI-powered full-stack generator that produces production-grade React + Supabase applications from natural language prompts. The team shipped a working app in weeks without a dedicated engineering team.

Stack Breakdown

Layer	Detail
Frontend	React + Vite + Tailwind CSS (Lovable-generated)
Backend / DB	Supabase — PostgreSQL database, Auth, Storage, Edge Functions
Auth	Supabase Auth (email/password; OAuth expandable)
Hosting	Lovable Cloud (lovable.app subdomain, CDN-backed)
Calendar Integration	Apple Calendar & Google Calendar (planned via CalDAV / API)
Photos Integration	Apple Photos (planned)
Code Ownership	Full React + Supabase codebase exportable via GitHub at any time

Two Live Deployments

Property	URL / Purpose
Landing Page	lived-timeline-maker.lovable.app — waitlist capture + brand positioning
App (Auth)	evidenceoflife.lovable.app — authenticated user shell, core UI

Scalability Note

Lovable generates standard React + Supabase code fully owned by the team. When scale demands it, the codebase can be exported to GitHub and extended or migrated by any React/Node developer without platform lock-in.

03 Team Roles

Team Overview

Five-person founding team. Nearly all product development has been handled by one person. The remaining four members own brand, research, and demand generation.

Role Assignments

Person	Role	Primary Owns	On Demand
Willow Wu	Product / Engineering	Full-stack build (Lovable), app architecture, integrations, deployments	Tech debt triage, new feature scoping
Shan Ye	Strategy / Ops	MVP doc, investor narrative, research synthesis, go-to-market logic	Demand gen analysis, sprint planning
Judy Shi	Brand / Design	Visual identity, landing page copy, tone guidelines, creative direction	Social content, waitlist email copy
Hanzhi Bian	User Research / Design	Interview recruitment, persona validation, V1/V2 test synthesis, Front-end Designing	Ongoing ICP refinement, feedback loops, optimizing idea
Eric Xue	Growth / Demand Gen	Outreach campaigns, community posts, waitlist growth, channel testing	Analytics, conversion tracking

Known Gap

The team is currently single-threaded on engineering. The primary developer is the critical path for all product milestones. Priority for next 30 days: reduce that dependency by documenting build process and exploring Lovable's collaborative editing features.

04 What's Faked: Woz / Concierge Strategies

Philosophy

Evidence of Life is in Woz mode — the product vision is fully defined, but several core experiences are being delivered manually or approximated rather than built. This is intentional. We are testing demand before engineering automation.

The Reality Layer, Today

Feature	Status / Reality
Timeline Reconstruction	FAKED — Users manually confirm or log what actually happened. The "automatic" reconstruction shown in copy is the V2 build goal, not current state.
Apple Calendar Integration	FAKED — Calendar events are not yet auto-imported. Users currently add their plan data manually inside the app.
Photos Integration	FAKED — No live connection to Apple Photos or device camera roll. Memory layer is not yet functional.
Weekly Recap Feature	FAKED — Referenced heavily in V2 testing (highest-resonance feature for students). Not yet built.
"Automatic by Default" Claim	PARTIAL — Auth and UI shell are live. Core automation is the north star, not the current implementation.
Google Calendar Integration	PLANNED — Listed on landing page. Not yet wired.

What IS Real

- Landing page is live and collecting waitlist signups
- Auth shell exists at evidenceoflife.lovable.app — users can create accounts
- Core UI and timeline view are built and navigable
- Brand, positioning, and copy are fully developed
- 10-person synthetic V2 demand test completed with structured scoring
- Privacy and trust messaging fully in place

Concierge Path (Next 30 Days)

For early access users: manually onboard 5–10 users. Walk them through connecting their calendar and reconstructing a week by hand with the team. Use these sessions as live UXR before building automation.

05 Demand Gen Strategy

Target Audience

Primary: Students and young professionals who want to record what they did in a given day, week, or month — and look back on it. Key insight from interviews: many are already using Instagram Stories as a makeshift daily log. This is our clearest behavioral signal of latent demand.

Segment	Detail
Primary ICP	Overwhelmed students, Apple Calendar/Reminders users, grad students
Secondary ICP	Young professionals who feel weeks disappear without a record
Where they live online	Instagram (primary), TikTok, Twitter/X, Reddit (r/productivity, r/PKMS)
Existing behavior signal	Using Instagram Stories as a day-log — same job, wrong tool
Core pain	Days pass without evidence. No single place shows what actually happened.

Channel Overview

Channel	Budget	Status	Primary Goal
Paid Ads (Meta/Instagram)	$100	Planned	Waitlist signups <$5 CPA
Organic Social (Instagram, TikTok, Twitter/X)	$0	Planned	Brand awareness + waitlist clicks
Community (Reddit, Discord)	$0	Planned	Credibility + organic signups
Email Nurture	$0	Planned	Waitlist → early access conversion
Word of Mouth	$0	Active	Columbia network + team outreach

Paid Ads — Meta / Instagram

Field	Detail
Platform	Meta (Instagram feed + Stories)
Budget	$100 total test budget
Launch date	TBD — pending analytics setup
Target audience	18–28, US, interests: journaling, Apple ecosystem, productivity, memory/nostalgia, VSCO, BeReal
Success metric	Cost per waitlist signup under $5; landing page CVR above 15%

Ad Angles

- Angle 1 — Problem: "You planned your week. You took some photos. But there's no single place that shows what actually happened."
- Angle 2 — Behavioral mirror: "You're already using Instagram Stories as a day log. Evidence of Life does it automatically — and keeps it private."
- Angle 3 — Emotional: "Most days disappear. Not because they didn't matter. Because nothing kept them."

Organic Social

Field	Detail
Platforms	Instagram (primary), TikTok, Twitter/X
Posting frequency	3x per week across platforms — assumed; adjust based on capacity
Content lead	Judy Shi (brand) + Shan Ye (strategy narrative)

Content Themes

- Theme 1 — Problem stories: "I interviewed students about how they remember their weeks. Here's what they said."
- Theme 2 — Behavioral insight: "People are using Instagram Stories as a journal. That's not an accident."
- Theme 3 — Build-in-public: Behind the scenes of building Evidence of Life — design decisions, user tests, pivots.

First 3 Posts (Planned)

Post	Date	Hook + Angle

Post 1	Week of Mar 9	"We interviewed 10 people about how they remember their weeks. 0 of them had a good answer." — Problem framing, waitlist CTA
Post 2	Week of Mar 16	"People are using Instagram Stories as a day log. We built something better." — Behavioral insight, product tease
Post 3	Week of Mar 23	"Here's what plans vs. reality actually looks like for a grad student." — Relatable use case, UI preview

Community (Reddit, Discord)

Field	Detail
Target communities	r/productivity, r/PKMS, r/Notion, r/selfimprovement, r/college
Approach	2-week participation before any product mention. Answer questions, share insights from user research.
Product mention timing	Week 3+, framed as: "I built this after interviewing students about how they remember their weeks"
Discord targets	Productivity-focused servers, student study servers, indie maker communities

Email Nurture Sequence

Field	Detail
Tool	TBD — Loops, ConvertKit, or Mailchimp recommended
Trigger	Immediately on waitlist signup

Email	Subject Line	Content
Email 1 — Immediate	"You're on the list."	Welcome + set expectations. Ask: "What's the one thing you wish you could remember about this week?"

Email 2 — Day 3	"Why we're building this."	Founder story. The gap between plans and reality. Why no existing tool closes it.
Email 3 — Day 7	"Here's what we've learned."	Share a V2 research finding. Show that real people feel this pain. Build anticipation.
Email 4 — Launch	"It's ready. You're first."	Early access invite for waitlist. Concierge onboarding offer for first 10 users.

Current Numbers (as of March 2026)

Metric	Value	Note
Waitlist Signups	147	Since landing page launch
Landing Page Visitors (30d)	~820	Organic + direct traffic
Waitlist Conversion Rate	~18%	Visitors → signups
Demand Test Participants	10	Synthetic V2 persona tests
Resonance Score ≥4 (1–5)	5 / 10	Strong-fit segment: overwhelmed students
Intent to Try ≥4	5 / 10	Apple ecosystem users
Top Dealbreaker	Subscription pricing	Price sensitivity among students
Strongest ICP	Overwhelmed students, Apple ecosystem	Graduate student / Apple Calendar users

Success Metrics

Channel	Target Metric
Primary goal	200 waitlist signups by end of March 2026
Paid ads	CPA under $5, landing page CVR above 15%
Organic social	500+ impressions per post, 5%+ engagement rate
Email	40%+ open rate on Email 1, 10%+ click rate on launch email
Community	3+ meaningful threads participated in before product mention

Tracking Setup (Week 1 Priority)

- Install Plausible or PostHog on landing page — track visitors, scroll depth, CTA clicks
- Set up Meta Ads Manager before any paid spend launches
- Configure email tool and connect to waitlist form
- Create a simple weekly tracker: signups by channel, CVR, top referral sources

Week 1 Launch Checklist

- Analytics installed and verified on landing page
- Email tool configured — Email 1 (welcome) live and triggering
- First organic social post published (Post 1 — problem framing)
- Joined r/productivity and r/PKMS — made first 3 genuine comments
- Meta Ads Manager account set up, creative drafted, not yet launched

V2 Test Key Findings

- Automation messaging and explicit privacy section were the two biggest conversion lifters vs. V1
- Weekly recap framing significantly increased intent among overwhelmed students
- Strongest personas: overwhelmed students (Apple Calendar), privacy-sensitive journalers
- Weakest personas: low-pain professionals, anti-productivity skeptics
- Top remaining blocker: no visual product demo — requested by 3 of 10 testers; unlock before paid ads launch
